PROBLEM OVERVIEW

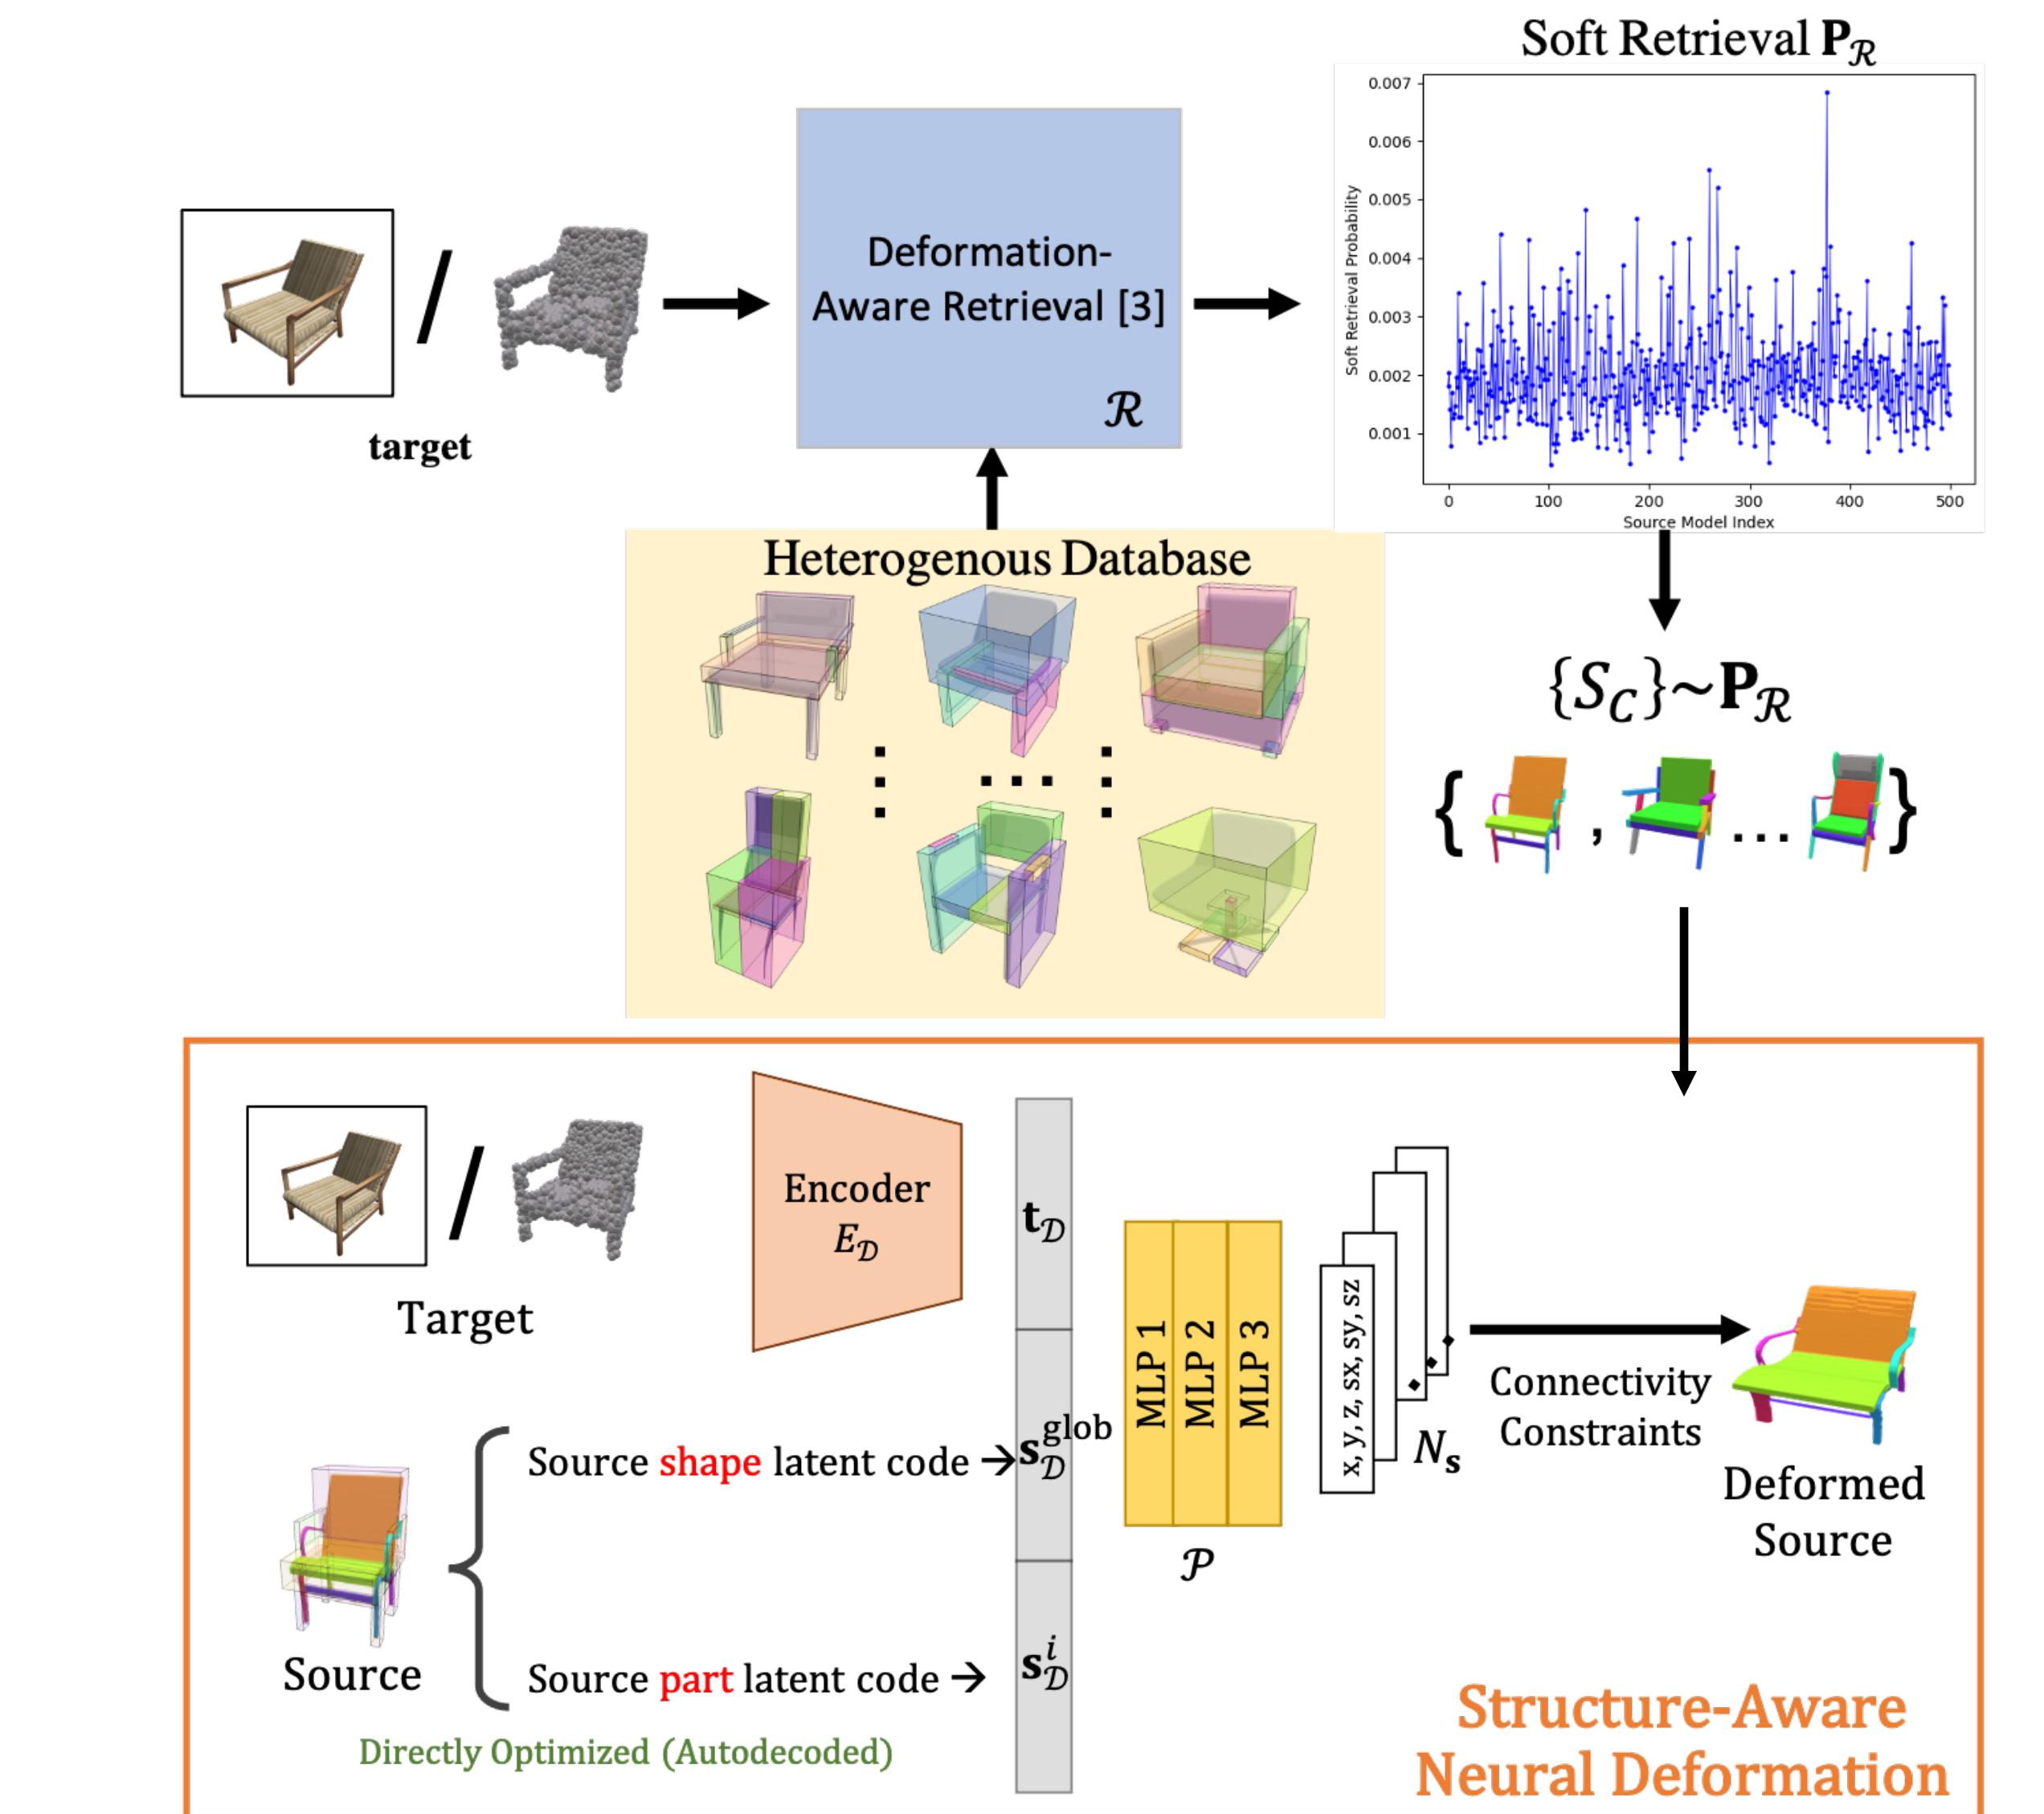

WHY JOINT LEARNING?

- Deformation-aware Retrieval**
 - embedding that retrieves models that fit **after** deformation
- Retrieval-aware Deformation**
 - embedding can aid the selection of better source-target pairs
- Two modules that are trained **jointly** optimizing network capacity.

OUR APPROACH

Soft Retrieval

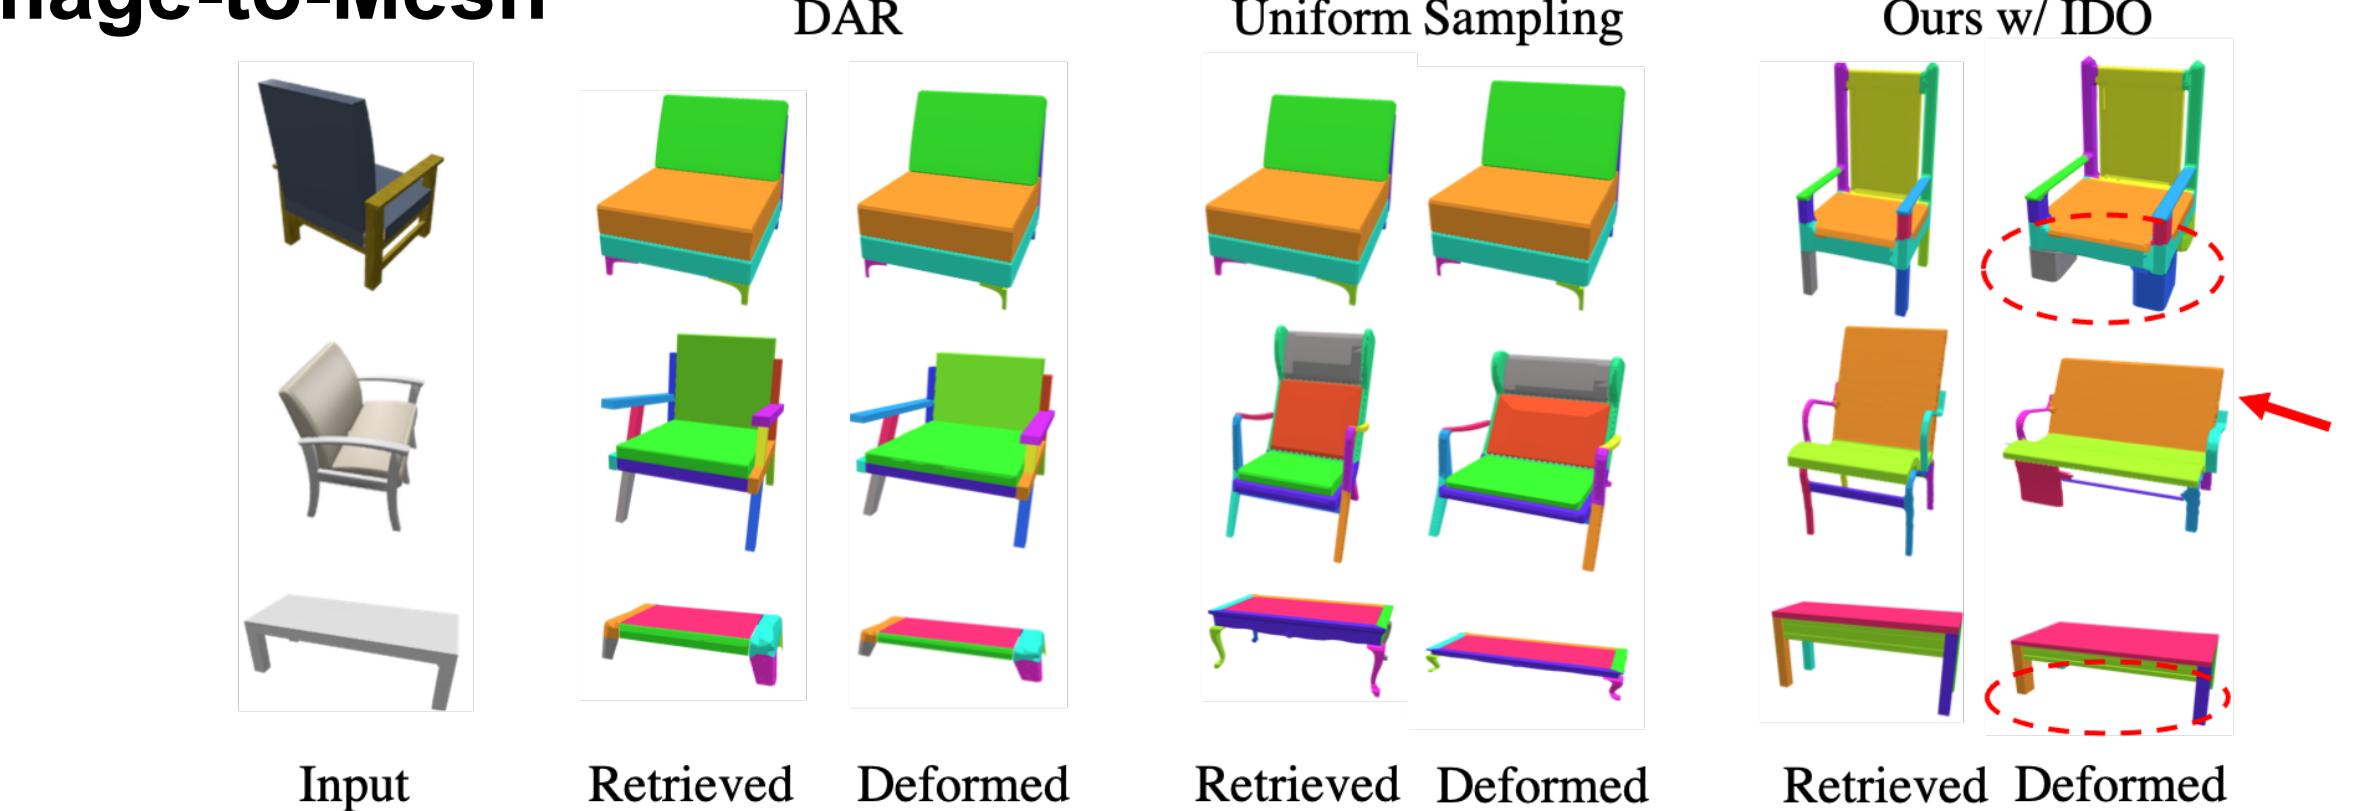

- Distance to the target in latent space \mathcal{R} reflects the probability of selecting each source.
- Sample source candidates based on this distribution
- Retrieval and deformation modules alternately optimized with these pairs.

Structure-Aware Neural Deformation

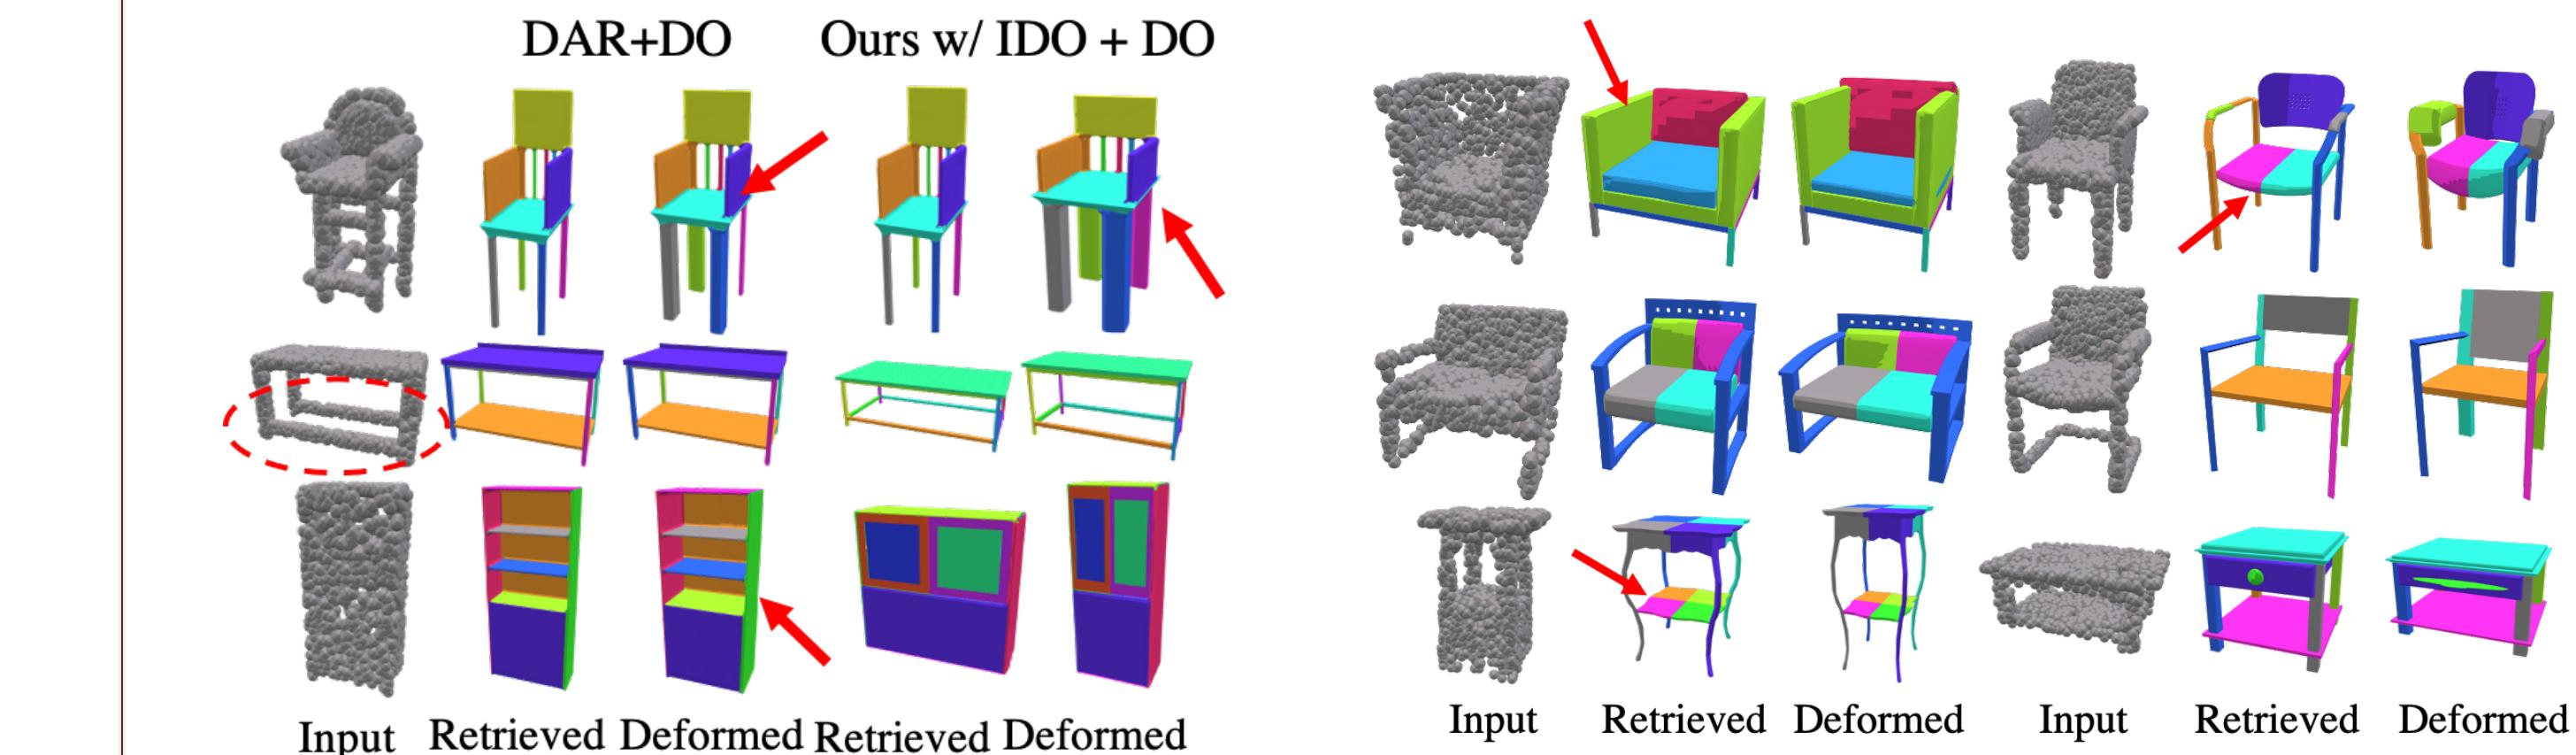

- Trained on source-target pairs selected by soft retrieval.
- Able to handle a **heterogeneous database**:
 - Varying number of parts for each source models
 - Manual (PartNet) and automatic (ComplementMe) segmentations
 - Source dependent part-to-part connectivity constraints

RESULTS

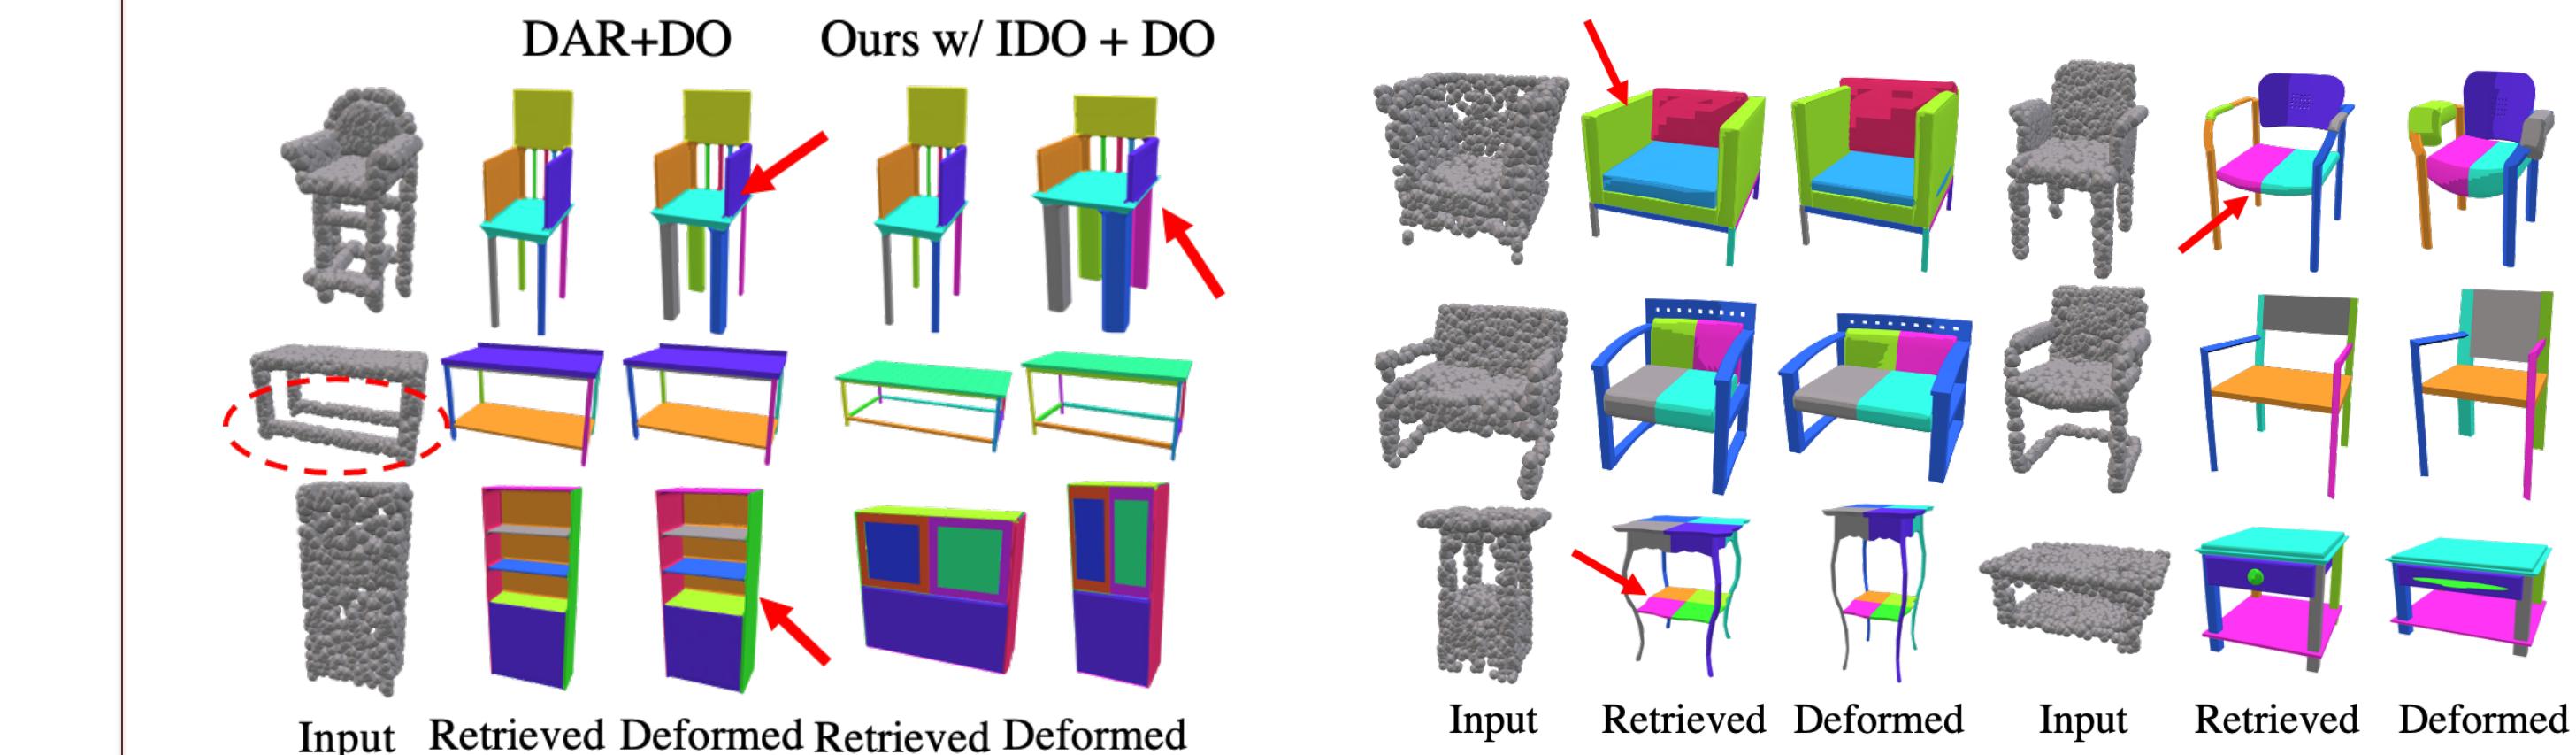

Image-to-Mesh

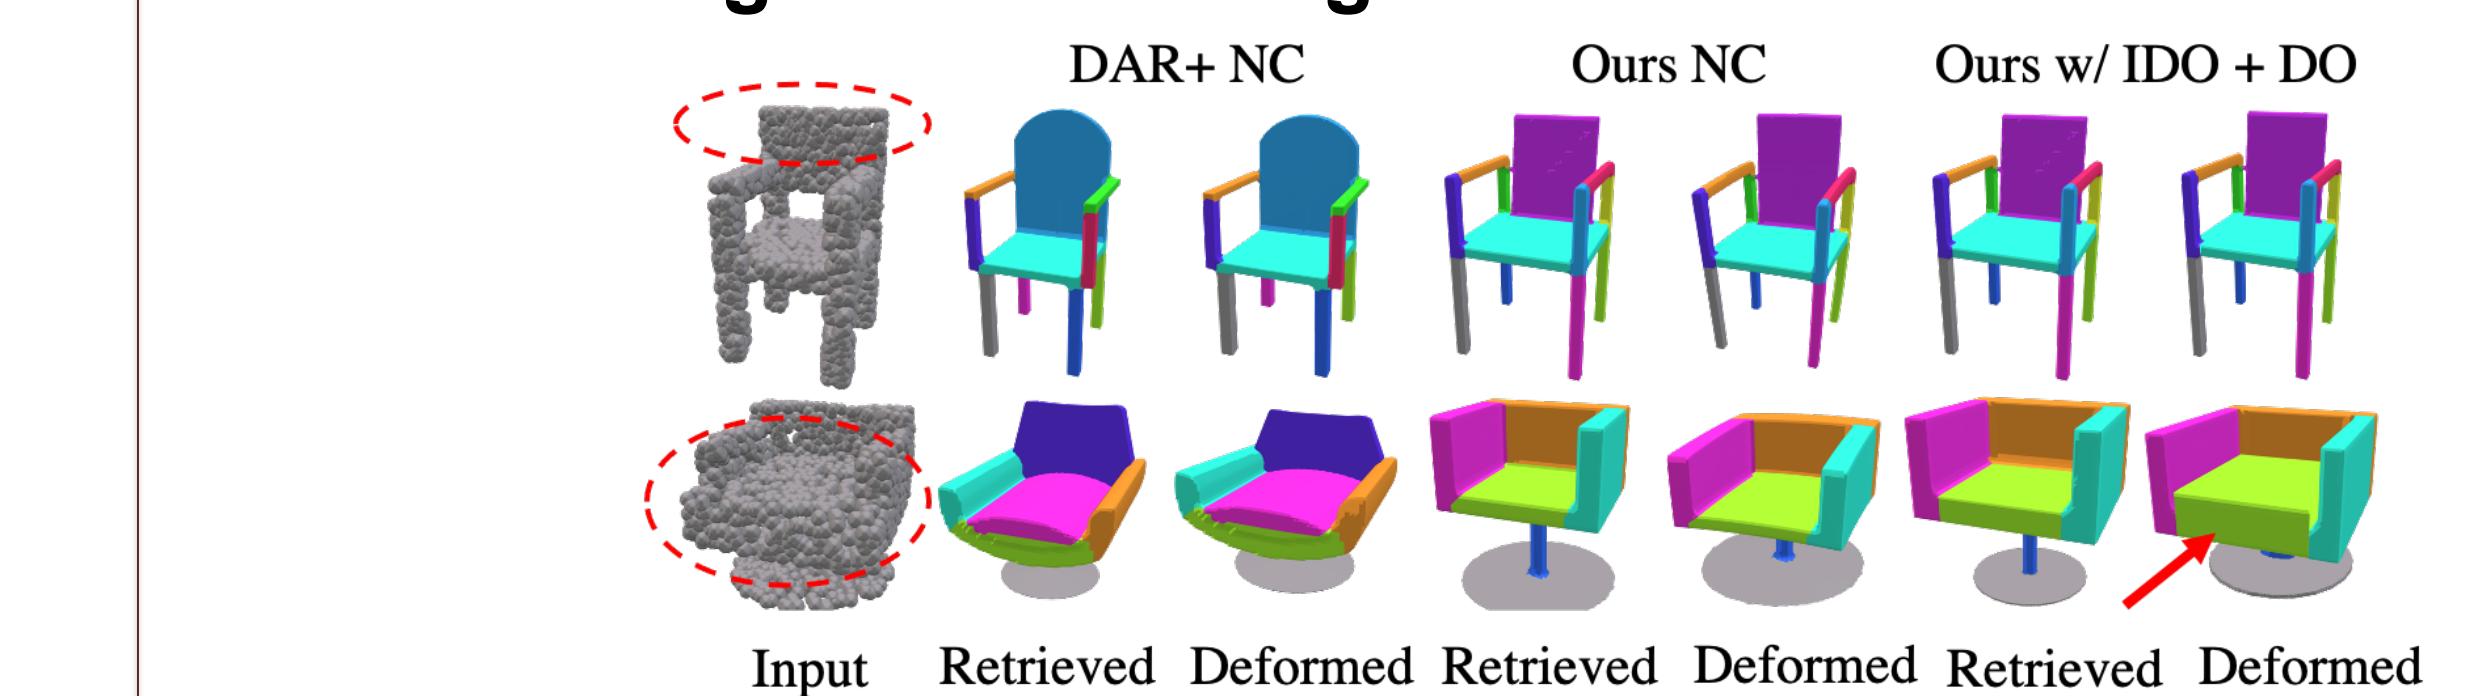

Point Cloud-to-Mesh

Automatic Segmentation

Joint Training on Neural Cages

Applications
